ABSTRACT
The seeds of Nigella sativa L., known as black seed are commonly used in traditional medicine by many Asian and Middle Eastern Countries to treat abdominal pain, headache, diarrhea, coughs, asthma and many other diseases. This seed extracts are found to have antioxidant and anticancer activities. Thymoquinone, is the active principle which is responsible for these beneficial effects. This work studied the effect of Nigella Sativa on colon cancer HCT 116 cell lines and found methanolic extracts of Nigella Sativa seeds has more phytochemical compounds having maximum inhibitory scavenging and anticancer activities.

KEYWORDS: Nigella Sativa, thymoquinone, HCT – 116 cell lines, HPLC.

INTRODUCTION
The human body is made up many living cells. These cells grow, divide, and die in an orderly process which are tightly regulated and controlled by the DNA machinery present within the cell. In adult, most cells divide either to replace dying cells or to repair. When the cells start growing out of control in a particular site, those may become abnormal cells which are then known as cancerous cell. In addition, these cancerous cells can also invade other tissues.[1] Colorectal cancer is the development of abnormal cells in the colon or rectum. It is due to the abnormal growth of cells which has the ability to invade and spread throughout the body. Signs and symptoms may include blood in stool, bowel movement changes and loss. Colorectal cancer (CRC) is the third most common cancer in the world.[2] Recently medicinal plants are effectively used for the treatment of colon cancer. Medicinal plants contain chemo preventive molecules. During the last 20 years 45% of drugs used for the colon cancer treatment are directly derived from plants; while the other 35% are derived chemically from natural products. The major advantage of using such compounds for cancer treatment is because of their relatively non-toxic, bio availability and anti-tumor properties.[3] The main objective of this work was to study the effect of Nigella Sativa on colon cancer HCT 116 cell lines

HCT 116 cell line
Organism: Homo sapiens, human

Tissue: colon
Product Format: Frozen
Morphology: Epithelial
Culture Properties: Adherent
Disease: Colorectal carcinoma
Age: Adult
Gender: Male
Storage Conditions: Liquid nitrogen vapor phase

Human colorectal carcinoma (HCT116) cell line was obtained from American Tissue Culture Collection (ATCC) and grown in Roswell Park Memorial Institute medium (RPMI-1640) supplemented with 2gm of sodium bicarbonate. The pH 7.4 was maintained and the cells were incubated at 37°C with 5% CO2 in humidified incubator. HCT116 cells (5.0 X 104) were plated in 96 well plates with Serum free RPMI-1640 media aliquots with plant extracts at 0, 2, 4, 8, 16, 32, 64 and 128 μg/ml concentration in triplicates and incubated for 24 hours at 37°C in a 5% CO2 incubator.[4]

HCT 116 cell line Applications
This cell line is a suitable transfection host. This line has a mutation in codon 13 of the ras proto-oncogene and can be used as a positive control for PCR assays of mutation in this codon.[5]

Nigella Sativa
Medicinal plants are paid special attention due to their low price, bioavailability and better acceptance by
patients in the treatment of human diseases.\(^6\) *Nigella sativa*, is also known as black cumin and panacea is a member of the Ranunculaceae family. It is approximately 20–30 cm in height and has white, yellow, pink, light blue or red flowers. The plant contains various compounds including nonvolatile oils, alkaloids, saponin, oleic and linoleic acids, thymoquinone (TQ), p-cymene, \(t\)-anethole, carvacrol, \(4\)-terpinenol and longifoline. Other components include sterols, phospholipids, tannins, resins, hydroxyl ketones, polyphenols, tocopherols and vitamins. TQ is an active component and has several immunoprotective properties effects such as antioxidant, anti-inflammatory, prevents liver and kidney toxicity.\(^8\)

Traditionally *N. Sativa seeds* are used as aromatic, anthelmintic, diuretic and diaphoretic. They are used as spices in cooking traditional Indian foods especially in vegetables. Tinctures obtained from these seeds are useful in diarrhea, loss of appetite and in the treatment of worms and skin eruptions. This seed oil applied externally is found to have an antiseptic property.\(^8\)

**Role of Thymoquinone in colon cancer treatment**

Natural anticancer drugs are of four classes that includes methyltransferase inhibitors, DNA damaging/pro-oxidant drugs, HDAC inhibitors (HDACi) and mitotic disrupters. Many medicinal plants and their composition have been analysed effectively in the identification and characterization of DNA methylation inhibitors. Chromatin acetylation is another major epigenetic modification that is regulated by the balanced action of histone acetyl transferases (HAT) and deacetylases (HDAC). HDAC inhibitors (HDACi) re activate epigenetically-silenced genes in cancer cells, triggering cell cycle arrest and apoptosis. Recent evidence suggests that dietary constituents, such as the iso thiocyanates found in cruciferous vegetables, can act as HDACi. Broccoli sprouts are a rich source of sulforaphane, an isothiocyanate that inhibits HDAC activity in human colon, prostate and breast cancer cells.\(^9\) The main bioactive component of the volatile oil of the black seed (*Nigella sativa*) is Thymoquinone (TQ) which is a pleiotropic agent targeting multiple signaling pathways in many patho-physiological conditions. The mechanisms in which thymoquinone prevents cells from cancer are antioxidant, antiinflammatory and by Inducing apoptosis.\(^10\) Thymoquinone causes lysosome membrane permeability and lead to leakage of lysosomal proteases, such as cathepsin B and D that induce apoptotic cell death.\(^11\)

**Cytotoxicity studies using HCT116 cell line by MTT assay**

Traditionally, the in vitro determinations of toxic effects of unknown compounds have been performed by counting viable cells after staining with a vital dye. Alternative methods used are measurement of radioisotope incorporation as a measure of DNA synthesis, counting by automated counters and others which rely on dyes and cellular activity. The MTT system is a means of measuring the activity of living cells via mitochondrial dehydrogenases. The MTT method is simple, accurate and yields reproducible results. The key component is \([3-4, 5-\text{dimethylthiazol-2-y1}]\)-2, 5-diphenyl.\(^12\)

**MATERIALS AND METHODS**

**Sample**

*Nigella Sativa* seeds were bought from University of Agricultural sciences, Bengaluru. The seeds were air dried at room temperature and grinded in to powder using electric grinder and stored for experimental analysis.

**Extract Preparation**

Eight different solvent extracts of *N. Sativa* seeds were prepared to screen the anti-bacterial activity. Finely grinded *N. Sativa* seed powder was subjected to aqueous and seven organic solvents. The dry extract then stored at 4°C for further use.\(^13\)

1. **Phytochemical analysis**

Phytochemical analysis of *Nigella Sativa* linn seed extracts were done using the protocols described by Aisha Kamal and Iflat Zareen Ahmad\(^14\) for the following.

- Test for Sterols - Salkowski reaction
- Tests for Alkaloids - Hager’s reagent and Wagner’s reagent (Iodine-potassium iodine)
- Tests for Tannins - Ferric chloride reagent test and Lead acetate test
- Tests for Saponins - Foam test
- Tests for Phenols - Ferric chloride reagent test and Lead acetate test
- Tests for Flavonoids
- Test for Terpenoids
- Test for cardiac glycosides

2. **DPPH antioxidant assay**

**Principle**

DPPH [1,1-diphenyl-2-picryl hydrazyl] is a stable free radical with purple colour. Antioxidants reduce DPPH to 1, 1-diphenyl-2-picryl hydrazine, colourless compound which is measured at an absorbance of 510 nm.

**Procedure**

In brief, 75 µl of DPPH solution; various concentration of test solution and quantity sufficient to 3 ml with HPLC grade methanol. The different concentrations tested for reference standard are 0.5, 1.0, 1.5, 2.0, 2.5 mcg/ml. The reaction mixture is mixed and incubated at 25°C for 15 minutes. The absorbance is measured at 510 nm using semi-autoanalyzer. A control reaction is carried out without the test sample.\(^15\)
3. HPLC analysis

Plant Extraction
10gms plant powder was extracted with 50ml methanol at 50°C for 4 hours. The methanolic extracts were filtered through Whatmann No. 1 filter paper and filtrate was evaporated to dryness. Methanolic extract (10mg/ml) was used for HPLC analysis.

Quercetin Standard: 100ug/ml prepared in methanol.

HPLC Condition
Instrument: Shimadzhu LC- Prominence 20AT
Column: C18 column 250 mm x 4.6 mm, 5u particle
Mobile Phase: Linear HPLC grade Acetonitrile (60%), HPLC grade water (40%) Flow Rate: 1.0 ml/min
Injection volume: 10ul

Quantification of Quercetin in plant extracts:
Concentration of Standard injected: 100µg/ml
Sample concentration: 10mg/ml

Formula used for quantification of quercetin in plant extract
Quercetin (Microgram/gram) = Sample area / Standard area x Standard concentration injected x Standard concentration injected.

4. Cytotoxicity studies using HCT116 cell line by MTT assay

HCT 116 cell line was obtained from American Type Culture Collection (ATCC) (Rockville, MD USA) (ATCC Number: CCL-247™). The steps and procedure for cell culture, Thawing, Revival and Propagation of Cells were followed as described by D. F. Basri et al. [16]

Procedure
- Collected the cells when they reach about 70-80% confluency.
- Check for the viability and centrifuge the cells.
- About 50,000 cells / well were seeded in a 96 well plate and incubate for 24 hrs at 37°C, 5% CO2 incubator.
- Add samples to be tested from 0-320µg/ml (2 fold variation) concentration in RPMI without FBS & are incubated for 24 hr.
- After incubation with test samples, add 100µl/well (50 µg /well) of the MTT (5 mg/10ml of MTT in 1X PBS) was added to the respective wells and incubated for 3to 4 hours.
- After incubation with MTT reagent, discard the MTT reagent by pipetting without disturbing cells and add 100 µl of DMSO to rapidly solubilize the formazan.
- Measure the Absorbance at 590 nm.

Calculating Inhibition
% Inhibition = 100 – (OD of sample/OD of Control) x 100.

RESULTS AND DISCUSSION

1. Phytochemical analysis of Nigella Sativa linn seed extracts

From Table 1, the qualitative analysis of *Nigella Sativa* seed extracts showed the presence of different phytochemical compounds such as Alkaloids, Terpenoids, tannins, flavanoids, Reducing sugar, quinines, proteins, steroids, tannins, flavanoids, saponins and Diterpens. However, Terpenoids and Anthocyanins were found absent.

2. DPPH antioxidant assay

![Fig.1: Radical scavenging activity of Quercetin and Nigella sativa](image1)

It is well known that flavanoids have the capacity to quench free radicals. The antioxidants such as flavanoids reduce DPPH to 1, 1-diphenyl-2-picrylhydrazine. Hence the presence of phytochemical components show radical scavenging assay. Saponins also a class of natural products which react against leukemia, lymphoma and other cancer. From Fig 1, the comparative study of DPPH scavenging assay between Quercitin and *Nigella Sativa* using IC50 values was found to be 78.60. It may be due to the presence of anticancer activity such as colon cancer.
